

Business Objective

What

The Automated Network Request Management project aims to streamline and automate the complete lifecycle of network-related service requests using the ServiceNow platform.

The solution will provide a centralized mechanism for users to submit network requests, route them to the appropriate support teams, obtain required approvals, automate fulfilment activities, and track requests until completion.

Why

Traditional network request management can involve manual submission, email-based communication, repetitive approvals, and limited visibility into request status. These activities can increase processing time, create human errors, and make it difficult to consistently enforce organizational policies.

Therefore, the proposed solution focuses on using ServiceNow workflows and automation to make network request fulfilment faster, standardized, traceable, and policy-compliant.

How

The business objectives will be achieved through the following capabilities:

1. Reduce manual effort and human error

- Automate repetitive request-processing activities.
- Minimize manual data entry and handoffs.
- Automatically route requests to the appropriate teams.

2. Accelerate request fulfilment

- Automate approval and assignment processes.
- Reduce delays caused by manual communication.
- Provide predefined workflows for common network requests.

3. Standardize workflows and approvals

- Establish consistent request-processing procedures.
- Implement predefined approval stages based on request type and risk.
- Ensure requests follow organizational policies.

4. Improve visibility and tracking

- Maintain all network requests in a centralized ServiceNow platform.

- Allow users and support teams to track request status.
- Provide dashboards and reports for operational monitoring.

5. Enhance end-user experience

- Provide a simple and standardized request submission process.
- Give users visibility into request progress.
- Reduce waiting time and improve service reliability.

6. Ensure compliance with IT and security policies

- Incorporate appropriate approvals and authorization checks.
- Maintain an audit trail of request activities.
- Ensure network-related requests are processed according to organizational security requirements.

Outcome

The expected outcome is a centralized and automated network request management process that reduces manual intervention, improves processing efficiency, provides greater visibility, and ensures that network requests are handled consistently according to organizational policies.

Business Objective Summary

Objective	Expected Business Benefit
Reduce manual effort	Less repetitive work and fewer human errors
Automate fulfilment	Faster processing of network requests
Standardize workflows	Consistent request handling
Automate approvals	Reduced approval delays
Centralize tracking	Better visibility and accountability
Improve user experience	Faster and more transparent service
Enforce security policies	Better compliance and governance
