

Functional Scope

What

The **Automated Network Request Management** solution will cover the configuration and automation of the complete network service-request process within ServiceNow.

The functional scope includes the creation of a **Service Catalog**, design of user-friendly request forms, automated approval routing, workflow automation using **Flow Designer**, and email notifications to keep users and support teams informed throughout the request lifecycle.

Why

Defining the functional scope establishes the specific capabilities that will be implemented in the project. It ensures that the solution focuses on automating the key activities involved in network request processing while avoiding unnecessary functionality outside the project's objectives.

The scope is designed to reduce manual intervention, improve processing consistency, and provide users with better visibility into their requests.

How

The project will implement the following functional components:

1. Service Catalog Creation

- Create a dedicated catalog for network-related services.
- Provide standardized catalog items for different network requests.
- Define appropriate request information and required fields.

2. Form Design

- Design user-friendly forms for submitting network requests.
- Configure appropriate field types, mandatory fields, and choices.
- Capture all information required for request processing and fulfilment.

3. Approval Routing

- Configure automated approval mechanisms.
- Route requests to the appropriate approver based on predefined conditions.
- Ensure requests requiring authorization are not fulfilled without the necessary approval.

4. Flow Designer Automation

- Create automated flows for the request lifecycle.

- Trigger flows when a network request is submitted.
- Automate activities such as approval, assignment, status updates, and fulfilment.
- Reduce the need for manual intervention by support teams.

5. Email Notifications

- Configure notifications for important request events.
- Notify users when requests are submitted, approved, rejected, assigned, or completed.
- Keep relevant support teams informed about request progress.

Outcome

The functional scope will result in a **standardized and automated network request management process** in ServiceNow. Users will be able to submit network requests through the Service Catalog, while approvals, workflow activities, and notifications will be handled automatically according to predefined business rules.
