

APPROVAL REQUEST

What

An Approval Request related list will be configured on the Database Tables / Network Database record.

This allows users and administrators to view approval records associated with a particular network database/request directly from its form.

The configuration consists of:

1. Creating an Approval Request relationship.
2. Adding the resulting related list to the Network Database form.

Why

Approval information is an important part of the network request lifecycle. By displaying approval records directly on the Network Database form:

- Approvers can be associated with the appropriate request.
- Approval status can be monitored from the request record.
- Administrators can easily track approval activity.
- The request and its approval information remain connected.
- The solution provides better traceability and audit visibility.

Activity 1 – Creation of Related List Relationship

What

Create a ServiceNow Relationship that connects records in the Network Database table with records from the sys approval table.

How

1. Navigate to:

All → System Definition → Relationships

2. Click **New**.
3. Enter the relationship details:

Field	Value
Name	Approval Request

Field Value

Applies to table Database Tables

Queries from table sysapproval / approval table specified by the lab

Active True

- 4. Review the relationship configuration.
- 5. Click **Submit** or **Save**.

1 to 20 of 500

Outcome

The Approval Request relationship is created and can now be used to display related approval records on the Network Database form

Activity 2 – Add Approval Related List to the Form

What

Add the approval-related list to the Network Database form so that users can see associated approval records directly from the record.

Why

Displaying approvals on the same form provides a centralized view of the request and its approval information, reducing the need to navigate to another table.

How

1. Navigate to the **Database Tables / Network Database** table.
2. Open an appropriate Network Database record.
3. Open the form configuration/design interface.
4. Locate the **Related Lists** section.
5. Add the **Approval Request** related list.
6. Arrange the related list in the desired position.
7. Save the form configuration.
8. Reopen the Network Database record.

9. Scroll to the related-list section.
10. Verify that **Approval Request** is displayed.

Validation

Create or use a Network Database record that goes through an approval process.

Verify that:

- The Network Database record opens successfully.
- The **Approval Request** related list is visible.
- Associated approval information appears in the related list when an approval record exists.

- The approval information is associated with the correct request.

Expected Result

Network Database Record

Outcome

The Network Database form now provides a centralized view of its associated approval information. This improves approval visibility, traceability, and operational monitoring throughout the request lifecycle.

Important Configuration Note

Your instructions say sysapprovals, while ServiceNow environments commonly use approval-related tables such as sysapproval_approver. Follow the exact table specified by your capstone instance/instructions, rather than changing it based on a generic ServiceNow setup.

Also, your instruction says “configure the approvals on Network Database table.” This means don't stop after creating the relationship—the final evidence should show the Approval Request related list actually visible on a Network Database record.
