

CONCLUSION

The Automated Network Request Management solution successfully demonstrates how ServiceNow can be used to streamline and automate the lifecycle of network-related service requests.

The solution provides a structured Service Catalog interface for request submission, dynamic forms for capturing relevant information, automated approval processing, record creation, and email notifications. These capabilities reduce manual effort, improve data accuracy, and provide better visibility into request status and processing.

The use of Flow Designer, UI Policies, Catalog Variables, Variable Sets, approvals, and ACLs provides a maintainable and configuration-focused implementation while minimizing unnecessary custom development.

The solution also establishes a scalable foundation for future enhancements such as infrastructure integrations, automated provisioning, advanced reporting, and expansion to other IT services.

Key Outcomes

- **Streamlined Request Intake** – Users can submit network requests through a standardized Service Portal interface.
- **Improved Data Quality** – Mandatory fields, dynamic form behavior, and structured data storage reduce incomplete or inconsistent information.
- **Automated Processing** – Flow Designer reduces repetitive manual activities throughout the request lifecycle.
- **Controlled Approvals** – Approval processing provides authorization before requests proceed.
- **Improved Transparency** – Request records, approval information, and notifications provide better visibility to stakeholders.
- **Enhanced Maintainability** – A configuration-first approach makes the solution easier to maintain and hand over.
- **Scalable Foundation** – The solution can be extended to additional IT services and future infrastructure integrations.

Final Outcome

Overall, the project demonstrates how ServiceNow can transform a traditionally manual network-request process into a structured, automated, and trackable service-management solution.

By combining standardized request intake, validation, approvals, automation, notifications, and centralized tracking, the solution helps improve operational efficiency, service reliability, and user experience while providing a strong foundation for future IT service automation.
